HSBC Flash China Manufacturing PMI™

Manufacturing output down for second successive month, albeit at marginal rate

Key points

- Flash China Manufacturing PMI™ at 49.1 (48.3 in March). 2-month high.
- Flash China Manufacturing Output Index at 49.1 (47.3 in March). 2-month high.

Data collected 12-19 April.

The HSBC Flash China Manufacturing *Purchasing Managers' IndexTM (PMITM)* is published on a monthly basis approximately one week before final PMI data are released, making the HSBC PMI the earliest available indicator of manufacturing sector operating conditions in China. The estimate is typically based on approximately 85%–90% of total PMI survey responses each month and is designed to provide an accurate indication of the final PMI data.

China Flash Manufacturing PMI™ Summary

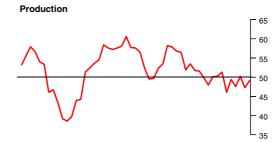

50.0 = no change on previous month (seasonally adjusted)

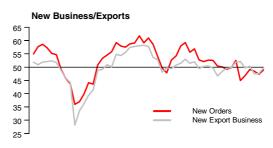

: PMI	Contraction, slower rate	
Output	Contraction, slower rate	
New Orders	Contraction, slower rate	
New Export Orders	Contraction, slower rate	
Employment	Contraction, slower rate	
Backlogs of Work	Expansion, slower rate	
Output Prices	Decline, slower rate	
Input Prices	Inflation, slower rate	
Stocks of Purchases	Contraction, faster rate	
Stocks of Finished Goods	Broadly stable, fall last month	
Quantity of Purchases	Contraction, slower rate	
Suppliers' Delivery Times	Lengthening, slower rate	

Commenting on the Flash China Manufacturing PMI survey, Hongbin Qu, Chief Economist, China & Co-Head of Asian Economic Research at HSBC said:

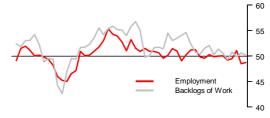

"As April flash PMI ticked higher, this suggests that the earlier easing measures have started to work and hence should ease concerns of a sharp growth slowdown. That said, the pace of both output and demand growth remains at a low level in an historical context and the job market is under pressure. This calls for additional easing measures in the coming months. We expect monetary and fiscal easing to speed up in 2Q."

Notes to Editors:

Final April data are published on 2 May 2012.

The HSBC China Report on Manufacturing is based on data compiled from monthly replies to questionnaires sent to purchasing executives in over 420 manufacturing companies. The flash estimate is typically based on approximately 85%–90% of total PMI survey responses each month and is designed to provide an accurate advance indication of the final PMI data.

The average differences between the flash and final PMI index values (final minus flash) since comparisons were first available in January 2008 are as follows (differences in absolute terms provide the better indication of true variation while average differences provide a better indication of any bias):

Index	Average difference	Average difference in absolute terms
HSBC China Manufacturing PMI	0.0	0.6
HSBC China Manufacturing Output Index	0.1	0.9

The panel is stratified by Standard Industrial Classification (SIC) group and company size, based on industry contribution to Chinese GDP. Survey responses reflect the change, if any, in the current month compared to the previous month based on data collected mid-month. For each of the indicators the 'Report' shows the percentage reporting each response, the net difference between the number of higher/better responses and lower/worse responses, and the 'diffusion' index. This index is the sum of the positive responses plus a half of those responding 'the same'.

The *Purchasing Managers' IndexTM (PMITM)* is a composite index based on five of the individual indexes with the following weights: New Orders - 0.3, Output - 0.25, Employment - 0.2, Suppliers' Delivery Times - 0.15, Stock of Items Purchased - 0.1, with the Delivery Times index inverted so that it moves in a comparable direction.

Diffusion indexes have the properties of leading indicators and are convenient summary measures showing the prevailing direction of change. An index reading above 50 indicates an overall increase in that variable, below 50 an overall decrease.

Markit do not revise underlying survey data after first publication, but seasonal adjustment factors may be revised from time to time as appropriate which will affect the seasonally adjusted data series. Historical data relating to the underlying (unadjusted) numbers, first published seasonally adjusted series and subsequently revised data are available to subscribers from Markit.
