Kameron, Data Science and Engineering

Speaker: Kameron

Kameron: There are not many opportunities for graduate-level data scientists out there. HSBC takes that chance on entry-level applicants. And then obviously, once you have a few years' experience, the world opens up quite drastically.

I would say the best part of the Data Science Graduate Programme is the technical and professional skills I have developed. You can also test your communication and presentation skills. For instance, I have given presentations on different machine-learning algorithms to the team. There are also opportunities to go on spring insight panels and recruitment events.

If you take the opportunities, there is a lot to do. There is plenty of social events. We have our own office PlayStation, we have our own mini-golf. So it is quite a nice atmosphere, and it is somewhere I can see myself staying for a while.

The current graduate intake of which I am a part of is the first graduate intake at HSBC. So this has really given us the opportunity to be very important within the team. And as the new graduates come in, we will be partially responsible for them as well.

I would say the graduate programme will equip me for my future career by providing me with both the hard and soft skills required to be a data scientist. [It is] also the first footstep in the path of my career.

[Text on screen] As you grow, we grow. Together we thrive.
